The invention relates to a system for, and a method of, oil skimming for recovering oil skimmed from water by means of a skimming net. Two methods are generally used for recovering the oil skimmed from water by means of a skimming net. The first method consists in dumping the oil skimmed into the sea after being collected into a tank floating on the surface of the water. This method consists of two successive phases, namely, the phase for recovering the oil skimmed from the water, and the phase for recovering the oil skimmed from the oil skimmed from the water. In the first phase, the oil skimmed from the water is collected by using a skimming net, and the oil collected is transferred by the skimming net into a containment tank floating on the surface of the water. The skimming net is a flat plastic net, or equivalent plastic mesh, which is thrown into the water and is anchored by means of weights to its edges. The oils skimmed are then separated from the water by filtration, or by gravity, or by pumping. In the second phase, the oil which has been collected into the containment tank is then transferred by means of an engine into a recovery vessel. This method requires the acquisition of apparatus for recovering the oil skimmed, and installation of the apparatus requires high capital investment and the intervention of specialist personnel. The second method consists in emptying the oil skimmed by means of a skimming net into a pipe which is located on the surface of the water. This method consists of a single phase, namely, that of emptying the oil skimmed by means of a skimming net into a pipe located on the surface of the water. The oil skimmed by means of a skimming net then flows into the pipe, and is then pumped by means of a pump into a recovery tank located on the deck of a boat or on a similar installation which is connected to the recovery vessel. In the second method, the oil is recovered into a tank which is on board the recovery vessel. However, this method also requires the acquisition of an installation on the deck of the recovery vessel for collecting the oil skimmed by means of a skimming net. In both cases, the equipment is located in the water during the periods of low water and in the ground during the periods of high water, or when the oil is transferred by gravity. These methods may be used in an area of shallow water, i.

Q: Trying to find the closest point on a sphere So I just started learning this whole "closest point" thing and I'm having problems understanding the algorithm... I am trying to find the closest point on a sphere to a given point (x,y,z). For testing purposes I did it for the four corners of the sphere which were (0,0,0) (0,1,0) (1,0,0) (0,0,1) and my program found that all the points were equally close... (0.5,0.5,0.5) which is on top of the sphere... Would anybody know why this is? I understand that the final position of a point is this $z = (x^2 + y^2 + 0.5)^{1/2}$ where ^ is power. Here is my code: public class ClosestPointOnSphere {
/** * @param args the command line arguments */ public static void main(String[] args) { // TODO code application logic here
int max = 1000; double x0 = -100.0, y0 = -200.0, z0 = 0.0; double x1 = 100.0, y1 = 100.0, z1 = 0.0; double x2 = 100.0, y2 = -100.0, z2 = 0.0; double x3 = -100.0, y3 = 100.0, z3 = 0.0; double x4 = -100.0, y4 = -200.0, z4 = 0.0; double xf, yf, zf; double d = Math.pow((x1-x0),2)+(Math.pow(y1-y0,2))+(Math.pow(z1-z0,2))+Math.pow((x2-x0),2)+(Math.pow(y2-y0,2))+Math.pow(z2-z0,2) +Math.pow((x3-x0),
