There is also AutoCAD LT, a relatively new version of AutoCAD, which is bundled with a Windows operating system and is limited to simple drawings (2D and 3D) and 2D layout. AutoCAD is a computer-aided design (CAD) program for Windows, macOS, and Linux. The product was developed and marketed by Autodesk. One of the most popular CAD products in the world, AutoCAD and related products like AutoCAD LT are often used by architects and civil engineers. AutoCAD is a true breakthrough in that it was the first true CAD program where you could enter drawing elements directly on the computer screen instead of working on a mechanical drawing board. This saved a lot of time and the drawers are "paperless". This is also a good feature for architects because it enables them to draw any size CAD drawings. It also has a built-in 3D/2D modeling tool and many other features to help users create accurate drawings. Learning AutoCAD? In short, it's a very well-rounded program for creating 2D, 3D drawings, and layouts. AutoCAD is an application that lets you design and create 2D and 3D drawings. 3D drawings in AutoCAD can be created from 2D objects or using other CAD tools to create 3D models. You can place your drawing on the stage or anywhere on your screen (depending on the version you are using). AutoCAD is also capable of translating drawings between other formats, such as Adobe Illustrator and the native AutoCAD formats. The more complex the drawing, the more features are available. However, as you need more features, you need to pay more for the program. There is a wide range of drawing features available in AutoCAD ranging from simple text to advanced engineering drawings. AutoCAD is really more of a drafting package. AutoCAD can also create templates for new drawings. For example, you can create a drawing that has a title, a background and multiple layers. You can give this drawing a title and store it to make a template. You can give it any number of layers, and each layer can have any number of items on it. You can save the templates and share them with others or even create them using a shared folder. You can use the various layers in your template

API Some of the AutoCAD APIs are available by default, and others require registration. The more powerful APIs are all required to be registered as part of the licensing agreement. The Windows operating systems support the add-on API (Add-on Package or AMOP) in which an add-on application runs in a separate process and is loaded via DLLs and is updated by separate downloads. The Autodesk Exchange Apps feature allows creation of Autodesk Exchange plugins. It is offered free of charge as part of the AutoCAD subscription. ActiveX ActiveX is a component that runs under Microsoft Windows operating systems that allows developers to add additional functionality to their applications, or to integrate other applications. ActiveX is included in AutoCAD 2004, 2008 and 2010. Microsoft has confirmed that ActiveX will not be available in AutoCAD LT. Applications that require ActiveX are required to register the ActiveX component, and have their software certified. Modules Modules are application add-ons that add functionality to AutoCAD or improve its capabilities. The functionality and capabilities of the modules are configured in the interface Designer. The modules must be downloaded from the AutoCAD Exchange Store. As of AutoCAD 2017, the names of the modules that are available in AutoCAD have been changed from those that existed in previous versions. In some instances, the names were changed due to a name change of the underlying technology, or name changes made by the developer. In AutoCAD 2014, several significant new feature modules were added, including: Subscription AutoCAD AutoMate

Before I went to bed and after I woke up the application stopped running, and I can't figure out why. The only change I made was changing IntegerField to CharField, from the docs I don't really understand what happens when I change IntegerField to CharField. class Signup(models.Model): user = models.OneToOneField(User) class Meta: unique_together = (('user', 'password'),) def save(self, *args, **kwargs): if not self.pk: self.created = datetime.datetime.now() self.user = get_object_or_404(User, pk=self.user) if not self.user.check_password(self.password): raise forms.ValidationError('Wrong password') else: self.last_login = self.user.last_login if self.last_login: self.user.login(self.last_login) return super(Signup, self).save(*args, **kwargs) def __str__(self): return "{}".format(self.user) Here are the two changes, from models.py: class Signup(models
